Makrolon® multi UV 2/6-8
Multiwall polycarbonate sheet

**Your benefits:**
- high impact strength
- cold-bendable
- ideal for barrel vaults

Makrolon® multi UV 2/6-8 is a twinwall polycarbonate sheet of 6 mm thickness. It combines high light transmission, thermal insulation and excellent weather resistance. The sheet is lightweight, impact resistant and easy to install.

Makrolon® multi UV 2/6-8 is ideal for cold-curved barrel vaults. It can also be installed as flat glazing.
- porches, shelters
- covered walkways
- swimming pool covers
- greenhouses
- partition walls
- industrial glazing
- skylights, northlight glazing
- roofing

The manufacturing width of 2,100 mm is particularly suitable for sections that are cut to size across the width.

The sheets are produced with a coextruded UV-protective layer, which is homogeneously fused with the sheet material. This UV-protected side must be installed facing upwards/outwards. It provides Makrolon® multi UV with a highly effective protection against weathering, guaranteed for 10 years.

(1) The cold-bending must be parallel to the ribs of the sheets, never crosswise (risk of buckling).
(2) Fire certificates are limited in time and scope; always check if the mentioned certificate is valid for the purchased polycarbonate sheet type at the date of delivery. Polycarbonate sheets may change their fire behavior due to ageing and weathering. The indicated fire rating was tested on new/unweathered Product in accordance with the indicated fire classification standards, except for Product rated "B1" in accordance with DIN 4102.

The manner in which you use and the purpose to which you put and utilize our products, technical assistance and information (whether verbal, written or by way of production evaluations), including any suggested formulations and recommendations, are beyond our control. Therefore, it is imperative that you test our products, technical assistance, information and recommendations to determine to your own satisfaction whether our products, technical assistance and information are suitable for your intended uses and applications. These values are guide values, evaluated using test reports on similar products. Adequate safety values, which should be assessed on a case-by-case basis, are to be observed with regard to these values.

In general, experience has proven that a safety factor of 1.3 is adequate with regard to the measured resistance values. This safety factor is included in the load tables and diagram.

These specifications do not replace national regulations, such as building inspectorate approval in Germany (DIBt), Avis Techniques in France, etc.

**Makrolon® multi UV 2/6-8**

Multiwall polycarbonate sheet

Covestro S-Line, the standard product line, represents a range of certified quality products which offer the reliable solution for most applications.

When using **Makrolon® multi UV 2/6-8** in roof or wall installations, the forces exerted by snow and wind loads must be absorbed by a suitable substructure. We recommend implementing the support distance indicated in the diagram for the respective loads.

The diagram shows the load-bearing capacity of **Makrolon® multi UV 2/6-8** (supported on all sides, rebate depth ≥ 20 mm) with a standard profile on the longitudinal sides. The load-bearing curves enable the user to calculate the actual load-bearing characteristics of the multi-wall sheets in their support construction.

If the rebate depth is smaller, the support distances should be reduced in accordance with the relevant load. For wind forces alone, the loads are permitted to be multiplied by 1.1.

**Load bearing characteristics (determination):**

The component resistance (limit state of load-bearing capacity) of **Makrolon® multi UV 2/6-8** has been defined in accordance with the European guideline ETAG 010 regarding practical tests. The characteristic values identified were calculated on the longitudinal sides by considering the chucking effect (standard profiles). The results were partially applied to other widths using simplified, conservative models. The loads were applied as uniformly distributed linear loads, i.e. loads such as snow acting perpendicular to the sheet.
